

N of reco track vs dxy

N of associated (recoToSim) tracks vs dxy

Figure 10 consists of two panels. The top panel is a log-linear plot of 'fake tracks' versus 'track dxy (cm)'. The y-axis is logarithmic, ranging from 10 to 1000. The x-axis ranges from -25 to 25 cm. Data points are shown for three different track types: black dots, blue dots, and red dots. A solid black line represents the fit to the data. The distribution is bell-shaped, peaking at 0 cm. The bottom panel is a linear plot of 'F' versus 'track dxy (cm)'. The y-axis ranges from 0.8 to 1.0. The x-axis ranges from -25 to 25 cm. Data points are shown for three different track types: black dots, blue dots, and red dots. A solid black line represents the fit to the data. The distribution is relatively flat, centered around 0.9.
